For linear regression, the model is  $f_{w,b}(x) = wx + b$ .

Which of the following are the inputs, or features, that are fed into the model and with which the model is expected to make a prediction?

☐  $m$

☐  $w$  and  $b$ .

☒  $x$

☐  $(x, y)$

✓ **Correct**

The  $x$ , the input features, are fed into the model to generate a prediction  $f_{w,b}(x)$

2. For linear regression, if you find parameters  $w$  and  $b$  so that  $J(w, b)$  is very close to zero, what can you conclude?

1 / 1 point

☐ The selected values of the parameters  $w$  and  $b$  cause the algorithm to fit the training set really poorly.

☐ This is never possible -- there must be a bug in the code.

☒ The selected values of the parameters  $w$  and  $b$  cause the algorithm to fit the training set really well.

✓ **Correct**

When the cost is small, this means that the model fits the training set well.
