## Gradient descent for logistic regression

$$\begin{split} \text{repeat } \{ \\ w_j &= w_j - \alpha \left[ \frac{1}{m} \sum_{i=1}^m \ (f_{\overrightarrow{\mathbf{w}},b} \Big( \overrightarrow{\mathbf{x}}^{(i)} \Big) - \mathbf{y}^{(i)}) \mathbf{x}_j^{(i)} \right] \\ b &= b - \alpha \left[ \frac{1}{m} \sum_{i=1}^m \ (f_{\overrightarrow{\mathbf{w}},b} \Big( \overrightarrow{\mathbf{x}}^{(i)} \Big) - \mathbf{y}^{(i)}) \right] \end{split}$$

## } simultaneous updates

$$f_{\overrightarrow{\mathbf{w}},b}(\overrightarrow{\mathbf{x}}) = \frac{1}{1 + e^{-(\overrightarrow{\mathbf{w}} \cdot \overrightarrow{\mathbf{x}} + b)}}$$

Which of the following two statements is a more accurate statement about gradient descent for logistic regression?

- O The update steps are identical to the update steps for linear regression.
- lacktriangle The update steps look like the update steps for linear regression, but the definition of  $f_{ec w,b}(\mathbf{x}^{(i)})$  is different
