## forward prop (coffee roasting model)

According to the lecture, how do you calculate the activation of the third neuron in the first layer using NumPy?

0

layer\_1 = Dense(units=3, activation='sigmoid')

$$a_1 = layer_1(x)$$

0

$$a1_3 = sigmoid(z1_3)$$

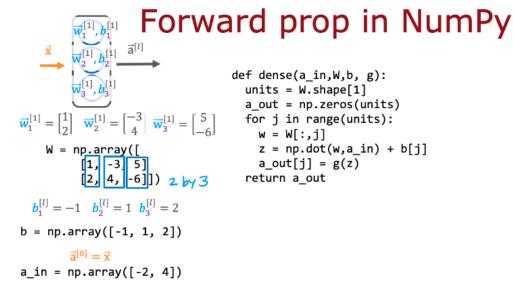

$$z1_3 = np.dot(w1_3, x) + b1_3$$

$$a1_3 = sigmoid(z1_3)$$

#### ( Correct

Correct. Use the numpy.dot function to take the dot product. The sigmoid function shown in lecture can be a function that you write yourself (see course 1, week 3 of this specialization), and that will be provided to you in this course.

2. 1/1 point

According to the lecture, when coding up the numpy array W, where would you place the w parameters for each neuron?

- O In the rows of W.
- In the columns of W.

## **⊘** Correct

Correct. The w parameters of neuron 1 are in column 1. The w parameters of neuron 2 are in column 2, and so on

### 1 / 1 point

# Forward prop in NumPy

```
\vec{x} \xrightarrow{\vec{w}_{1}^{[1]}, b_{1}^{[1]}} \vec{a}^{[l]} \xrightarrow{\vec{a}^{[l]}} \vec{w}_{2}^{[1], b_{1}^{[1]}} \xrightarrow{\vec{a}^{[l]}} \vec{w}_{3}^{[1], b_{3}^{[1]}} = \begin{bmatrix} 1 \\ 2 \end{bmatrix} \vec{w}_{2}^{[1]} = \begin{bmatrix} -3 \\ 4 \end{bmatrix} \vec{w}_{3}^{[1]} = \begin{bmatrix} 5 \\ -6 \end{bmatrix} 
\vec{w} = \text{np.array}([
\begin{bmatrix} 1 \\ -3 \\ 2 \end{bmatrix}, \begin{bmatrix} -3 \\ 4 \end{bmatrix}, \begin{bmatrix} 5 \\ -6 \end{bmatrix}]) \text{ 2 by 3}
\vec{v} = \text{np.dot}(w, a_{1}in) + b[j]
\vec{v} = \text{np.dot}(w, a_{2}in) + b[j]
\vec{v} = \text{np.dot}([j]) = \vec{v}
\vec{v} = \text{np.array}([-1, 1, 2])
\vec{v} = \text{np.array}([-1, 1, 2])
\vec{v} = \text{np.array}([-2, 4])
```

For the code above in the "dense" function that defines a single layer of neurons, how many times does the code go through the "for loop"? Note that W has 2 rows and 3 columns.

O 5 times

O 6 times

3 times

O 2 times

#### 

Yes! For each neuron in the layer, there is one column in the numpy array W. The for loop calculates the activation value for each neuron. So if there are 5 columns in W, there are 5 neurons in the dense layer, and therefore the for loop goes through 5 iterations (one for each neuron).
